AI-Powered Project Manager

5W1H Question Set — 5 Questions per Category

Problem statement: Teams often struggle with task coordination, missed deadlines, communication gaps, and manual follow-ups. An AI-powered project coordinator can extract tasks from conversations, suggest owners and deadlines, track progress, detect blockers, and automate reminders.

WHO — People Involved

1. Who are the primary target users of the AI project manager?

2. Who is responsible for creating and assigning project tasks?

3. Who monitors project progress and ensures deadlines are met?

4. Who identifies and resolves blockers when tasks are delayed?

5. Who should review and approve tasks generated by AI?

WHAT — Problem and Solution

1. What is the main project management problem faced by teams?

2. What information should each task contain?

3. What types of tasks and project activities need to be tracked?

4. What project management activities can the AI automate?

5. What features should the project manager dashboard provide?

WHERE — Platforms and Information

1. Where do teams currently manage projects and tasks?

2. Where do project-related conversations take place?

3. Where are project information, documents, and deadlines stored?

4. Where should AI-generated tasks and meeting action items appear?

5. Where should managers view overdue tasks, blockers, and project progress?

WHEN — Timing and Workflow

1. When should the AI analyze team conversations?

2. When should discussions be converted into actionable tasks?

3. When should team members receive deadline reminders?

4. When should the system flag overdue tasks or potential blockers?

5. When should project managers receive progress reports or escalations?

WHY — Reasons and Impact

1. Why do teams struggle to manage projects efficiently?

2. Why are tasks forgotten or deadlines missed?

3. Why does manual task assignment and follow-up take significant time?

4. Why is it important to identify blockers and risks early?

5. Why would teams benefit from an AI-powered project coordinator?

HOW — Implementation and Functionality

1. How will the AI identify tasks from team conversations?

2. How will the system suggest task owners and deadlines?

3. How will the system track progress and detect blockers?

4. How will the system automate reminders and follow-ups?

5. How will the system protect project data and allow users to verify AI-generated actions?

Suggested central problem statement: Manual Project Coordination, Task Tracking, and Communication Gaps in Team-Based Projects.
